# Tapered roller bearings, matched pairs

## Features

Tapered roller bearings comprise solid inner and outer rings with tapered raceways and tapered rollers in a window cage.

The classification and designation of tapered roller bearings in metric sizes is based on:

- DIN 720:2008
- ISO 355:2007
- ANSI/ABMA 19.1:2011 (prefix KJ).

The classification and designation of tapered roller bearings in inch sizes is based on:

- ANSI/ABMA 19.2:2013 (prefix K).

Tapered roller bearings in matched pairs are of an open design and are not self-retaining. As a result, the inner ring with the rollers and the cage can be mounted separately from the outer ring.

Tapered roller bearings in matched pairs are also available in the X-life design.

Metric and inch size bearings are available.

Furthermore, tapered roller bearings are also available by agreement in many other designs and sizes as well as for special applications. For advice on general availability, please consult Schaeffler.

## X-life

X-life is the premium brand that identifies particularly high performance products under the INA and FAG brands. They are characterised by longer rating life and operating life, due to higher basic dynamic load ratings compared to the previous standard.

This higher performance results from the use of state of the art manufacturing techniques and improved internal constructions. They lead to better and more uniform surfaces and contact areas and thus optimised load distribution in the bearing.

The detailed technical enhancements offer a range of advantages, such as:

- up to 20% higher basic dynamic load ratings  $C_r$
- higher running accuracy and smoothness of running
- lower-friction, more energy-efficient running (reduction in friction by up to 50%, in the case of tapered roller bearings with a steep taper up to 75%)
- lower heat generation in the bearing
- higher limiting speeds
- lower lubricant consumption and, consequently, longer maintenance intervals with relubrication
- a measurably longer operating life
- high reliability and operational security
- lower overall operating costs
- compact, environmentally-friendly bearing arrangements.

These advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

X-life tapered roller bearings include the suffix XL in the designation.

# Tapered roller bearings, matched pairs

## Radial and axial load carrying capacity

Single row tapered roller bearings can support axial forces in one direction and high radial forces.

If the load carrying capacity of one bearing is not sufficient or the shaft is to be guided with a certain axial clearance in both directions, ready-to-fit matched bearing sets are available.

In principle, there are three arrangements of matched tapered roller bearings, namely the X, O and tandem arrangement.

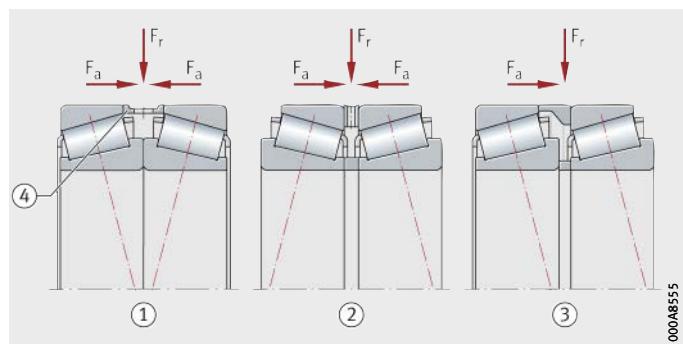

## Contact angle

The contact lines extending from the outer ring at less than  $90^\circ$  form a cone that determines the arrangement of the bearing sets, *Figure 1*. The contact lines of the rolling element forces intersect at the contact cone apexes, so the spacing between the contact cone apexes of two tapered roller bearings is the support base of the bearing arrangement.

- ① X arrangement
- ② O arrangement
- ③ Tandem arrangement
- ④ Gauge ring

$F_r$  = radial load  
 $F_a$  = axial load

*Figure 1*  
Arrangement of tapered roller bearings

000A8555

## X arrangement

In the case of bearing sets in an X arrangement, the contact lines converge relative to the bearing axis, *Figure 1*. While axial forces can be supported from both directions, this is only ever by means of one bearing. The construction of the X arrangement is simple and is the most frequently used arrangement of tapered roller bearings in a matched pair.

## O arrangement

In the case of bearing sets in an O arrangement, the contact lines diverge relative to the bearing axis, *Figure 1*. While axial forces can be supported from both directions, this is only ever by means of one bearing. The support base of the O arrangement is at its largest, which is beneficial if the component with small bearing spacing must be guided with the smallest possible tilting clearance or tilting forces must be supported. Bearing arrangements in an O arrangement are relatively rigid and can also support loads resulting from tilting moments.

## Tandem arrangement

In the case of bearing sets of a tandem arrangement, the contact lines run parallel to each other. In contrast to an X and O arrangement, the tandem arrangement can only support axial forces in one direction. In general, this bearing pair is adjusted against another tapered roller bearing, which supports axial forces in the opposite direction.

<b>Compensation of angular defects</b>	<p>At a load ratio <math>P/C_{0r} \leq 0,2</math>, the tilting of the bearing rings relative to each other must not exceed 4 angular minutes. The prerequisite in this case, however, is that the position of the shaft and housing axis remains constant (no dynamic movements).</p> <p>If larger loads, misalignments or dynamic angular defects are present, please consult Schaeffler.</p>
<b>Sealing</b>	Tapered roller bearings in matched pairs are not sealed.
<b>Lubrication</b>	Tapered roller bearings in matched pairs are not greased. These bearings must be lubricated with oil or grease.
<b>Operating temperature</b>	<p>Tapered roller bearings in matched pairs with an outside diameter <math>D \leq 220</math> mm can be used at operating temperatures from <math>-30</math> °C to <math>+120</math> °C. Tapered roller bearings in matched pairs with an outside diameter <math>D &gt; 220</math> mm can be used at operating temperatures from <math>-30</math> °C to <math>+200</math> °C.</p> <p>In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.</p>
<b>Cages</b>	Tapered roller bearings in matched pairs have sheet steel cages as standard. Other cages are available by agreement.
<b>Suffixes</b>	Suffixes for available designs: see Catalogue HR 1, Rolling Bearings and TPI 241, Tapered Roller Bearings of X-life Quality.
<b>Tapered roller bearings for special applications</b>	If tapered roller bearings are operated under very challenging conditions, for example at high operating temperatures or in heavily contaminated oil, special tapered roller bearings are available for such applications. In these cases, please consult Schaeffler.

# Tapered roller bearings, matched pairs

## Design and safety guidelines Equivalent dynamic bearing load

The rating life equation  $L = (C_r/P)^{\beta}$  used in the dimensioning of bearings under dynamic load assumes a radial load  $P$  of constant magnitude. If the bearing is subjected to purely radial load, the radial load  $F_r$  is used directly in the rating life equation ( $P = F_r$ ).

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load  $P$ .

Calculation of the equivalent dynamic bearing load  $P$  is dependent on the load ratio  $F_a/F_r$  and the factor  $e$ .

For matched tapered roller bearing pairs 313 (320, 322, 329)...DF-A under dynamic load, the following applies:

## Matched bearing pairs under dynamic load

Load ratio	Equivalent dynamic bearing load
$\frac{F_a}{F_r} \leq e$	$P = F_r + Y_1 \cdot F_a$
$\frac{F_a}{F_r} > e$	$P = 0,67 \cdot F_r + Y_2 \cdot F_a$

$P$  N  
Equivalent dynamic bearing load for combined load

$F_a$  N  
Axial dynamic bearing load of bearing pair

$F_r$  N  
Radial dynamic bearing load of bearing pair

$e, Y_1, Y_2$  –  
Factors for bearing pairs, see dimension tables.

## Determining the resulting internal axial force $F_a$ for single bearings and bearing pairs in an X and O arrangement

Single row tapered roller bearings transmit radial forces from one raceway to the other oblique to the bearing axis. In the case of a shaft supported by two single row tapered roller bearings of identical or different size, the radial load on bearing A leads, due to the inclination of the raceways ( $\alpha_0 \neq 0^\circ$ ), to an axial load on bearing B. In addition, the radial load on bearing B acts as an axial load on bearing A; external forces on such bearing systems are shown in *Figure 2* and *Figure 3*, page 8. This resulting internal axial force  $F_a$  must be taken into consideration in the calculation of the equivalent dynamic bearing load P.

Equations for calculating for resulting axial force  $F_a$ , see table, page 8.

Bearing A is subjected to a radial load  $F_{rA}$ , bearing B is subjected to a radial load  $F_{rB}$ , *Figure 2* and *Figure 3*, page 8.  $F_{rA}$  and  $F_{rB}$  act at the central contact points of the bearings and are always regarded as positive. The bearings are clearance-free but without preload.

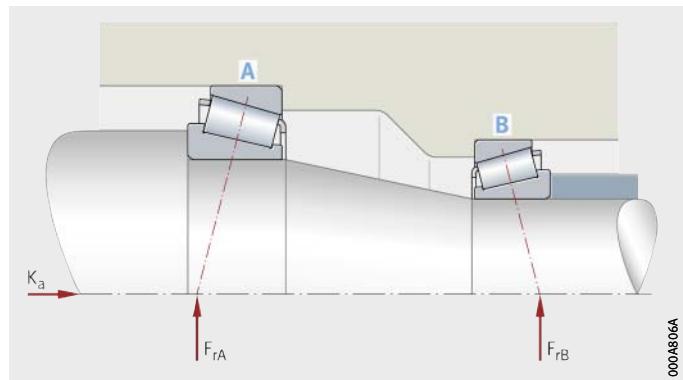

The equations given for determining the axial load correspond to an approximation solution assuming a load zone of  $180^\circ$  in bearings under radial load.

For more precise calculation, the use of BEARINX or BEARINX-online is recommended.

# Tapered roller bearings, matched pairs

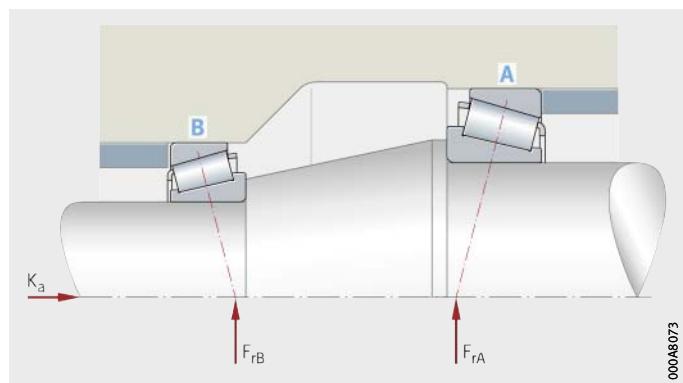

$K_a$  = external axial force acting on the shaft  
 $F_{rA}$  = radial load on bearing A  
 $F_{rB}$  = radial load on bearing B

$K_a$  = external axial force acting on the shaft  
 $F_{rA}$  = radial load on bearing A  
 $F_{rB}$  = radial load on bearing B

*Figure 3*  
Adjusted bearing arrangement  
with two single row tapered  
roller bearings in X arrangement,  
external forces

## Equations for determining the resulting internal axial force $F_a$

Load ratio	External axial force
$\frac{F_{rA}}{Y_A} \leq \frac{F_{rB}}{Y_B}$	$K_a \geq 0$
$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$	$K_a > 0,47 \cdot \left( \frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B} \right)$ $K_a \leq 0,47 \cdot \left( \frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B} \right)$

## Equations for determining the resulting internal axial force $F_a$ (continued)

Load ratio	Resulting axial force $F_a$	
	Bearing A	Bearing B
$\frac{F_{rA}}{Y_A} \leq \frac{F_{rB}}{Y_B}$	$F_{aA} = F_a = K_a + 0,47 \cdot \frac{F_{rB}}{Y_B}$	$F_a$ is not included in calculation
$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$	$F_{aA} = F_a = K_a + 0,47 \cdot \frac{F_{rB}}{Y_B}$ $F_a$ is not included in calculation	$F_a = 0,47 \cdot \frac{F_{rA}}{Y} - K_a$

<b>Equivalent static bearing load</b>	The equivalent static load $P_0$ is a calculated value. In radial bearings, it corresponds to a radial load. $P_0$ induces the same load at the centre point of the most heavily loaded contact point between the rolling element and raceway as the combined load occurring in practice.
<b>Matched bearing pairs under static load</b>	For matched tapered roller bearing pairs 313 (320, 322, 329)..-DF-A under static load, the following applies:
	$P_0 = F_{0r} + Y_0 \cdot F_{0a}$
	$P_0$ N Equivalent static bearing load for combined load
	$F_{0a}$ N Axial static bearing load of bearing pair
	$F_{0r}$ N Radial static bearing load of bearing pair
	$Y_0$ – Factor for bearing pairs, see dimension tables.
<b>Basic load ratings and fatigue limit load for bearing pairs</b>	For matched bearing pairs in an X arrangement, the basic load ratings and fatigue limit loads are given in the dimension tables. Matched bearing pairs in an O arrangement (suffix DB) or tandem arrangement (suffix DT) available by agreement.
<b>Minimum radial load</b>	In order that no slippage occurs between the contact partners, tapered roller bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/60$ is necessary. In most cases, however, the radial load due to the inherent weight of the bearing parts and the external forces is already higher than the requisite minimum load. If the minimum radial load is lower than stated, please consult Schaeffler.
<b>Speeds</b>	Two speeds are indicated in the product tables: ■ the kinematic limiting speed $n_G$ ■ the thermal reference speed $n_{\theta r}$
<b>Limiting speeds</b>	The limiting speed $n_G$ is the kinematically permissible speed of a bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler.
<b>Reference speeds</b>	The thermal reference speed $n_{\theta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed $n_{\theta}$ .

## Design of bearing arrangements

The mounting dimensions of the shaft and housing shoulders, spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders are defined on the basis of DIN 5418. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

### Cage projection

In matched pairs of tapered roller bearings, the cages project laterally to a certain extent. In order to prevent the cages grazing the adjacent construction, the lateral minimum distances  $C_a$  in the dimension tables must be taken into consideration in the design of the adjacent construction.

## Mounting and advantages of matched bearing sets

Schaeffler provides ready-to-fit bearing sets that no longer require adjustment. This gives simplified mounting. Simple mounting of the bearing sets in the mounting location is achieved through precise matching of the intermediate ring to the required geometrical axial internal clearance.

This offers considerable economic and technical advantages:

- Mounting is uncomplicated and mounting defects are prevented by the intermediate ring which is supplied already matched.
- The axial deflection of the bearings is known and taken into consideration which, together with thoroughly developed measurement methods, guarantees precise implementation of the geometrical axial internal clearance. This ensures precise axial guidance of the shaft.
- Simple maintenance and high operational security are achieved by design elements, lubrication grooves and holes in the intermediate ring.

The mounting and dismounting options for tapered roller bearings by thermal, hydraulic or mechanical methods must be taken into consideration in the design of the bearing position.

## Schaeffler Mounting Handbook

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

## Axial adjustment

Precise guidance of a shaft requires the correct definition of axial adjustment in the operating condition. This is the basis for optimum rating life of the bearing arrangement.

Axial adjustment in the operating condition is stated for the condition when warm from operation and under load. In general, the bearings should run free from clearance.

Tapered roller bearings offer the advantage that the clearance or preload can be adjusted in accordance with the specific requirements of the bearing arrangement.

## Preload

Axially preloaded tapered roller bearings allow high rigidity as well as high guidance accuracy and smooth running of the bearing arrangement. In colloquial terms, the preload can be described as negative axial clearance.

## Axial clearance

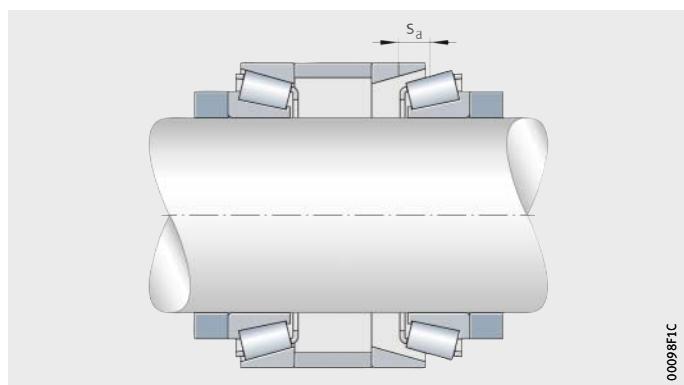

At high speeds in particular, the axial clearance prevents unexpected increases in bearing temperature and friction.

## Geometrical axial internal clearance

The total capacity for axial displacement from one extreme position to the other is indicated by the axial internal clearance  $s_a$ , *Figure 4*.

$s_a$  = axial internal clearance

*Figure 4*  
Axial internal clearance

00098FC

The adjustment values defined for the operating condition must be converted for mounting in the cold, load-free condition using the design data (geometrical axial internal clearance). Conversion is carried out in several stages. In *Figure 5*, examples of the rating life curves and the individual stages are shown. Knowledge of the rating life curves is the fundamental prerequisite for calculation. Rating life curves are derived from different load zone features and must be calculated specifically for each bearing.

## Tapered roller bearings, matched pairs

Starting from the optimum axial adjustment in the operating condition, the range of the geometrical axial internal clearance is calculated. The range of the geometrical axial internal clearance is dependent on the accuracy of the bearing components.

Conversion from a warm operating condition to a cold, load-free mounting condition is carried out taking account of the thermal expansion. The interaction of all components such as gears, shaft, rolling bearing and housing in operation must be taken into consideration.

The important factors for calculation are the axial and radial thermal expansions of the shaft and housing as well as the fit conditions.

Smoothing, running-in and settling effects can also be taken into consideration.

The result is a calculated axial clearance for mounting that is indicated in the product designation.

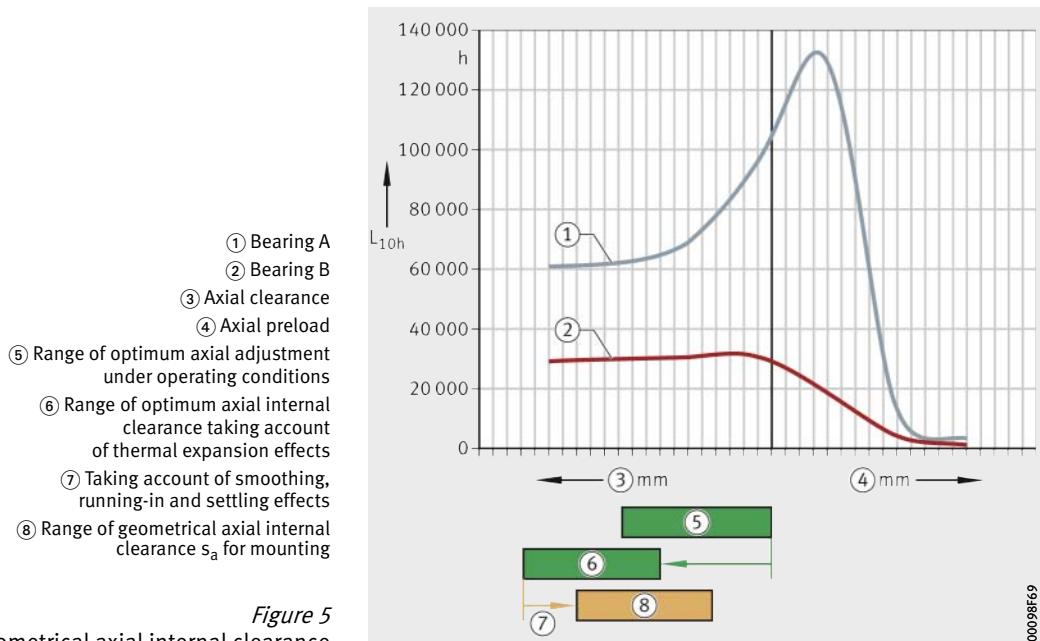

Figure 5  
Geometrical axial internal clearance

00098F69

**Accuracy**  
**Tapered roller bearings**  
**in metric sizes**

The main dimensions correspond to ISO 355:2007 and DIN 720:2008, the dimensional and running tolerances correspond to ISO 492:2014, see Catalogue HR 1, Rolling Bearings and TPI 241, Tapered Roller Bearings of X-life Quality.

**Tolerance for total width  
of matched bearings**

The tolerance for the total width  $2T$  of matched bearing sets of the DF design is determined from the axial internal clearance and the deviations of the width  $t_{\Delta TS}$  of the single bearings. The tolerance for the total width  $2B$  is determined from the deviations of the inner ring width  $t_{\Delta BS}$  of the single bearings.

The tolerance for the total width of bearing pairs in an O arrangement and in a tandem arrangement (suffix DB and DT) is determined from the axial internal clearance, the width of the single bearings and the width of the intermediate rings.

The intermediate rings are available in different widths upon customer request.

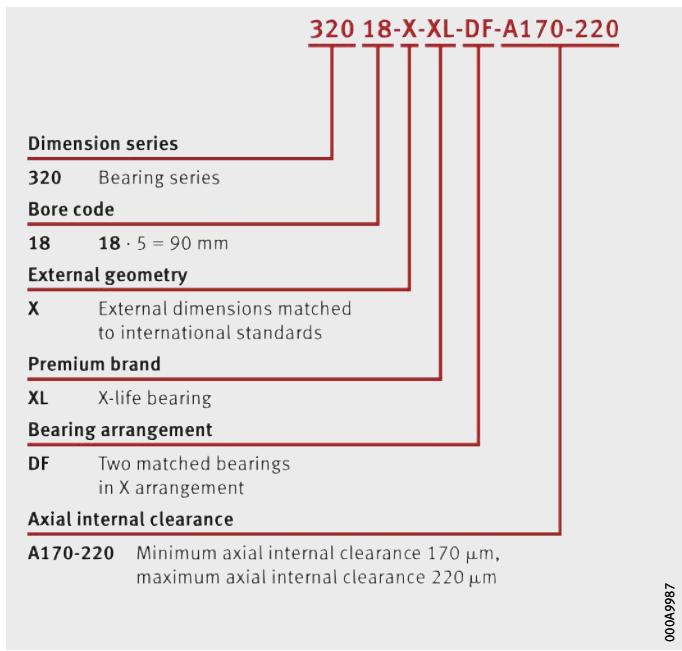

**Chamfer dimensions**

The limiting dimensions of the chamfer dimensions for metric tapered roller bearings in accordance with DIN/ISO correspond to ISO 582:1995.

## Ordering example, ordering designation

In order to simplify the ordering process, the ordering designation for matched pairs of tapered roller bearings has been changed:

- The first module letter D = 2 (Duplex) expresses the number of bearings.
- The arrangement of the bearings is represented by the second module letter:
  - B = O arrangement – Back to Back
  - F = X arrangement – Face to Face
  - T = tandem arrangement.
- Where necessary (special design), a third module letter is added as a consecutive counter for description of a variant.  
Example: A, B, ... = different set width, variant of intermediate ring design.
- The geometrical axial internal clearance is written in open form in the designation. As an example, “A170-220” indicates that the geometrical axial internal clearance of the bearing pair in the unmounted condition (delivered condition) is between 170  $\mu\text{m}$  and 220  $\mu\text{m}$ . Ordering example, *Figure 6*, page 15.  
If the designation instead contains “VA20-40”, for example, this mean that the bearing pair is axially preloaded and the negative axial clearance of the bearing pair in the unmounted condition is between 20  $\mu\text{m}$  and 40  $\mu\text{m}$ .

*Figure 6*  
Matched pair  
of tapered roller bearings:  
designation structure

000A9987

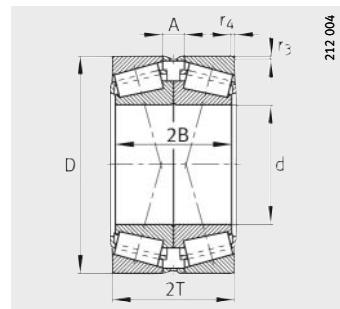

When ordering, the number of bearing pairs must be stated. In the case of tapered roller bearing pairs with the suffix N11, the ordering process will remain as before until this is superseded by new suffixes (DF, DB, DT). In this case, the number of single bearings must continue to be stated.
